What will we see?

Strong duality (informal)

For n > 1 bidders with additive utilities over m > 1 items

$$\begin{array}{ccc} & \max & \mathsf{Revenue} = & \min & \mathsf{Cost} \\ \mathsf{BIC} \ \mathsf{IR} \ \mathsf{mechanisms} & & \mathsf{transport} \ \mathsf{flows} \end{array}$$

- formal statement later
- left-hand side is intuitive ⇒ discuss the right-hand side

What will we see?

Strong duality (informal)

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+,π_- and transport costs c(x,y)

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+,π_- and transport costs c(x,y)

Find:

$$\min_{\substack{\gamma \in \Delta(X \times X) : \\ \text{marginals } \pi_+, \pi_-}} \int c(x,y) \, \mathrm{d}\gamma(x,y)$$

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+,π_- and transport costs c(x,y)

Find:

$$\min_{\substack{\gamma \in \Delta(X \times X) : \\ \text{marginals } \pi_+, \pi_-}} \int c(x,y) \, \mathrm{d}\gamma(x,y)$$

- archetypal coupling problem, many econ applications
- appears for n = 1 bidder
- transportation is immediate

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+,π_- and transport costs c(x,y)

Find:

$$\min_{\substack{\gamma \in \Delta(X \times X) : \\ \text{marginals } \pi_+, \pi_-}} \int c(x,y) \, \mathrm{d}\gamma(x,y)$$

- archetypal coupling problem, many econ applications
- appears for n = 1 bidder
- transportation is immediate

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+, π_- and transport costs c(x, y)

Find:

$$\min_{\substack{\gamma \in \Delta(X \times X) : \\ \text{marginals } \pi_+, \pi_-}} \int c(x,y) \, \mathrm{d}\gamma(x,y)$$

- archetypal coupling problem, many econ applications
- appears for n = 1 bidder
- transportation is immediate

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+, π_- and transport costs c(x, y)Find:

Find

transportation plan γ solving

$$\min_{\substack{\gamma \in \Delta(X \times X) : \\ \text{marginals } \pi_+, \, \pi_-}} \int c(x,y) \, \mathrm{d}\gamma(x,y)$$

- archetypal coupling problem, many econ applications
- appears for n = 1 bidder
- transportation is immediate

Beckmann's problem^a

^aM.Beckmann (1952) A continuous model of transportation Econometrica

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+, π_- and transport costs $c(x, y) = \pi_+, \pi_-$, costs $\Phi(x)$

Find:

transportation plan γ solving

$$\min_{\substack{\gamma \in \Delta(X \times X) : \\ \text{marginals } \pi_+, \pi_-}} \int c(x, y) \, \mathrm{d}\gamma(x, y)$$

- archetypal coupling problem, many econ applications
- appears for n = 1 bidder
- transportation is immediate

Beckmann's problem^a

Given:

$$\pi_+, \pi_-$$
, costs $\Phi(x)$

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+, π_- and transport costs c(x, y)

Find:

transportation plan γ solving

$$\min_{\gamma \in \Delta(X \times X)} \int c(x, y) \, \mathrm{d}\gamma(x, y)$$
marginals π_+, π_-

- archetypal coupling problem, many econ applications
- appears for n = 1 bidder
- transportation is immediate

Beckmann's problem^a

Given:

 π_+, π_- , costs $\Phi(x)$

Find:

flow $f: X \to \mathbb{R}^n$ solving

$$\min_{f \text{ s.t.}} \int \Phi(f(x)) dx$$
$$\operatorname{div}[f] = \pi_{+} - \pi_{-}$$

For given geographical distribution of production $\pi_+ \in \Delta(X)$ and consumption $\pi_- \in \Delta(X)$, $X \subset \mathbb{R}^d$, find least costly way of transportation

Monge-Kantorovich problem

Given:

 π_+, π_- and transport costs c(x, y)

Find:

transportation plan γ solving

$$\min_{\substack{\gamma \in \Delta(X \times X) : \int c(x,y) \, \mathrm{d}\gamma(x,y) \\ \mathsf{marginals} \, \pi_+, \, \pi_-}} \int c(x,y) \, \mathrm{d}\gamma(x,y)$$

- archetypal coupling problem, many econ applications
- appears for n = 1 bidder
- transportation is immediate

Beckmann's problem^a

Given:

 $\pi_+, \pi_-, \text{ costs } \Phi(x)$

Find:

flow $f: X \to \mathbb{R}^n$ solving

$$\min_{f \text{ s.t.}} \int \Phi(f(x)) dx$$

$$\operatorname{div}[f] = \pi_{+} - \pi_{-}$$

- transportation is continuous
- surprisingly, we get Beckmann not Monge-Kantorovich

^aM.Beckmann (1952) A continuous model of transportation Econometrica

What is the dual?

Beckmann:
$$\mathrm{B}_{\rho}\left(\pi,\Phi\right)=\min_{f\colon\operatorname{div}\left[\mathbf{\rho}\cdot f\right]+\pi=0}\int_{\mathbb{R}^{m}}\Phi(f(v))\cdot\mathbf{\rho}(v)\,\mathrm{d}v$$

Multi-bidder extension of Rochet-Chone representation

optimal revenue =
$$n \cdot \max_{\substack{\text{convex monotone } u \\ u(0) = 0, \\ \frac{\partial_{v_i} u(v) \leq z^{n-1} \, \forall i}{z \sim \text{Uniform}([0, 1])}} \int_{\mathbb{R}^m_+} u(v) \, \mathrm{d}\psi$$

Beckmann: $B_{\rho}(\pi, \Phi) = \min_{f : \operatorname{div}[\rho \cdot f] + \pi = 0} \int_{\mathbb{R}^m} \Phi(f(v)) \cdot \rho(v) \, dv$

Theorem (strong duality)

optimal revenue
$$= n \cdot \min_{\substack{\pi \succeq \psi \\ \varphi_i \text{ on } \mathbb{R}_+ \text{ s.t.}}} \left[\mathrm{B}_{\rho} \Big(\pi, \, \Phi \Big) + \sum_{i=1}^m \int_0^1 \varphi_i \left(z^{n-1} \right) \, \mathrm{d}z \right],$$
 where $\Phi(f) = \sum_{i=1}^m \varphi_i^*(|f_i|)$ and $\varphi_i^*(y) = \sup_x \langle x, y \rangle - \varphi_i(x)$

Question: How can it be that seller's problem admits two duals: Monge-Kantorovich and Beckmann?

Question: How can it be that seller's problem admits two duals: Monge-Kantorovich and Beckmann?

Beckmann's dual simplifies:

optimal revenue =
$$\min_{\pi \succeq \psi} B_{\rho} \Big(\pi, \| \cdot \|_{\mathbf{1}} \Big)$$

Question: How can it be that seller's problem admits two duals: Monge-Kantorovich and Beckmann?

Beckmann's dual simplifies:

optimal revenue =
$$\min_{\pi \succeq \psi} B_{\rho} \Big(\pi, \, \| \cdot \|_{\mathbf{1}} \Big)$$

Theorem (Santambrogio (2015))

$$B_{\rho}\Big(\pi,\,\|\cdot\|_1\Big) = \min_{\substack{\text{positive measures }\gamma\\ \text{with marginals }\pi_+,\,\pi_-}} \int \|v-v'\|_1\,\mathrm{d}\gamma(v,v')$$

8

Question: How can it be that seller's problem admits two duals: Monge-Kantorovich and Beckmann?

Beckmann's dual simplifies:

optimal revenue =
$$\min_{\pi \succeq \psi} B_{\rho} \Big(\pi, \| \cdot \|_{\mathbf{1}} \Big)$$

Theorem (Santambrogio (2015))

$$B_{\rho}\Big(\pi,\,\|\cdot\|_1\Big) = \min_{\substack{\text{positive measures }\gamma\\ \text{with marginals }\pi_+,\,\pi_-}} \int \|v-v'\|_1 \,\mathrm{d}\gamma(v,v')$$

Corollary: duality by Daskalakis et al. (2017)

Strong duality \Rightarrow complementary slackness conditions

- allow to disprove optimality
 - **Example:** For $\rho(v) = \rho_1(v_1) \cdot \ldots \cdot \rho_m(v_m)$, selling separately is never optimal¹
- help to guess an explicit solution and to prove optimality
 - **Example:** For n=1 and m=2 i.i.d. uniform items, selling each for $\frac{2}{3}$ or both for $\frac{4-\sqrt{2}}{3}$ is optimal²

¹P. Jehiel, M.Meyer-Ter-Vehn, B.Moldovanu (2007) Mixed bundling auctions JET

Strong duality \Rightarrow complementary slackness conditions

- allow to disprove optimality

 - **Example:** For n=1 and m=2 i.i.d. uniform items, selling each for $\frac{2}{3}$ or both for $\frac{4-\sqrt{2}}{3}$ is optimal²

Question: Any hope for an explicit solution with $n \ge 2$ and m = 2 i.i.d. uniform items?

²A.Manelli, D.Vincent (2007) Multidimensional Mechanism Design JET

Strong duality \Rightarrow complementary slackness conditions

- allow to disprove optimality
 - **Example:** For $\rho(v) = \rho_1(v_1) \cdot \ldots \cdot \rho_m(v_m)$, selling separately is never optimal¹
- help to guess an explicit solution and to prove optimality
 - **Example:** For n=1 and m=2 i.i.d. uniform items, selling each for $\frac{2}{3}$ or both for $\frac{4-\sqrt{2}}{3}$ is optimal²

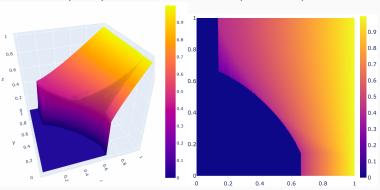

Question: Any hope for an explicit solution with $n \ge 2$ and m = 2 i.i.d. uniform items? **Perhaps, not**

Pictures for dessert: 2 bidders, 2 i.i.d. uniform items

Probability to receive the first item as a function of bidder's values (v_1, v_2) in the optimal auction (about algorithm):

Pictures for dessert: 2 bidders, 2 i.i.d. uniform items

Probability to receive the first item as a function of bidder's values (v_1, v_2) in the optimal auction (about algorithm):

Thank you!

Optimal u^{opt} , functions φ_i^{opt} , measure π^{opt} , and vector field f^{opt} satisfy:

$$\int u^{\text{opt}}(v) \, d\psi(v) = \int u^{\text{opt}}(v) \, d\pi^{\text{opt}}(v)$$
$$f_i^{\text{opt}}(v) \in \partial \varphi_i^{\text{opt}} \left(\frac{\partial u^{\text{opt}}}{\partial v_i}(v) \right)$$
$$\int \varphi_i^{\text{opt}} \left(\frac{\partial u^{\text{opt}}}{\partial v_i}(v) \right) \rho(v) \, dv = \int_0^1 \varphi_i^{\text{opt}} \left(z^{n-1} \right) \, dz$$

- Automated mechanism design: revenue maximization is an LP, let's feed it to an LP solver; Sandholm (2003)
- Curse of dimensionality: If each of n agents can have q different values for each of m items \Rightarrow the dimension $\sim (q^n)^m$
 - intractable for $(m=2, q=100 \ n=2)$ or for $(m=2, q=10 \ n=4)$
- How to avoid:

$$R_{n,m}(\rho) = \max_{\text{convex monotone } u} n \cdot \int_{\mathbb{R}^m_+} u(v) \, d\psi(v)$$
$$u(0) = 0, \ \partial_{v_i} u(v) \le z^{n-1}$$

- Pros: dependence on n is killed; Cai et al.(2012), Alaei et al. (2019)
- Cons: non-linear program
- Linearization via transport:
 - μ on [0,1] majorizes ν if and only if there is γ on $[0,1]^2$ with marginals μ on y and ν on x and such that $\int y \, \mathrm{d}\gamma(y \mid x) \geq x$ for γ -almost all x
 - solve for (u, γ)
- **Performance:** algorithm handles $(m = 2 \ q = 100 \ n = 10)$

- Automated mechanism design: revenue maximization is an LP, let's feed it to an LP solver; Sandholm (2003)
- Curse of dimensionality: If each of n agents can have q different values for each of m items \Rightarrow the dimension $\sim (q^n)^m$
 - intractable for $(m=2, q=100 \ n=2)$ or for $(m=2 \ q=10 \ n=4)$
 - deep neural networks improve the bounds; Dutting et al. (2019)
- How to avoid:

$$R_{n,m}(\rho) = \max_{\substack{\text{convex monotone } u \\ u(0) = 0, \ \partial_{v_i} u(v) \preceq z^{n-1}}} n \cdot \int_{\mathbb{R}^m_+} u(v) \, \mathrm{d}\psi(v)$$

Revenue (back to algorithmic ideas

Revenue as a function of the number of bidders n for two items with i.i.d. values uniform on [0,1]. Graphs from bottom to top: selling separately (light-green), selling optimally (blue), full surplus extraction (red), limit for $n \to \infty$ (the dashed line).

Remark: For n = 2, selling optimally improves upon selling separately by 5%
